

SURVEY AND MAINTENANCE

This includes traditional maintenance work, but can also be surveillance were we inspect equipment for areas that need to be attended to.

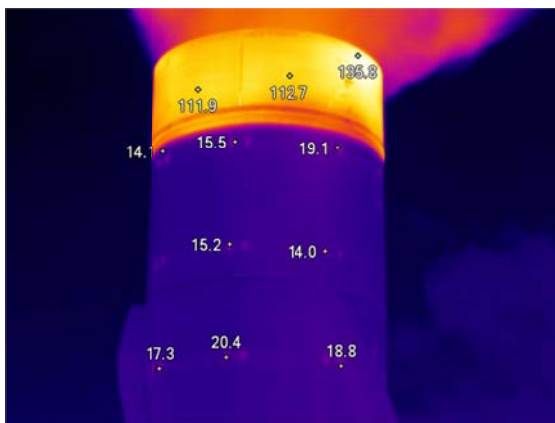

This includes

- Acoustical surveys of equipment that may be causing noise problems. After such a survey we will propose recommendations for corrective actions.
- “Infrared thermography” (thermal imaging):

By using this method we make “thermal” pictures of the system while it is operating, and the camera will then use “mathematical algorithms” to convert the electromagnetic radiation into pictures that are visible for the human eye. The presentation will also reflect the various temperature levels.
